Transformative Engineering New Audio Injector Allows Substitution of Audio Signals in HDMI Signal Path

Transformative Engineering has introduced the HAI-1 Audio Injector, a unique patented device that allows the user/installer to remove audio from an HDMI signal path.

The HAI-1 has one HDMI input and one HDMI output, stereo line-level or monaural inputs via RCA jacks and a monaural high-level speaker audio input. This configuration allows insertion of your own independent audio source, such as a local microphone, for narration in educational or corporate environments. One can also use CD/MP3 source material for background music through the TV's internal amplifier and speaker system. In a waiting room environment, the TV speakers and amplifier can be used to page customers, make announcements, or simply play music while the news is on your lobby TV.

The HAI-1 eliminates the need and additional cost of another separate amplifier, speakers and installation. The TE HAI-1 has a USB port for firmware updates.

Real life applications are up to your imagination!
